

Reducing supply temperature
in existing buildings
with advanced heating curve control technology

Outline

- 1- Introduction and context
- 2- PreHEAT: An advanced heating curve controller
- 3- Cases on Danish residential buildings
- 4- Conclusions

Neogrid Technologies

Founded in 2009 in Aalborg, today 8 people

Focus areas:

- ✓ Visualisation and monitoring technology for building heating
- ✓ Data collection from 'smart' meters and IoT sensors
- ✓ Energy-efficient and energy-flexible controllers
- ✓ Smart-grid controllers for heat-pumps and aggregator solution
- ✓ Custom-made solutions for demonstration projects in the energy sector

Collaboration-oriented

Experienced in research and demonstration (14 projects until now)

The DH agenda combines diverse targets

Global - Reducing our climate impact

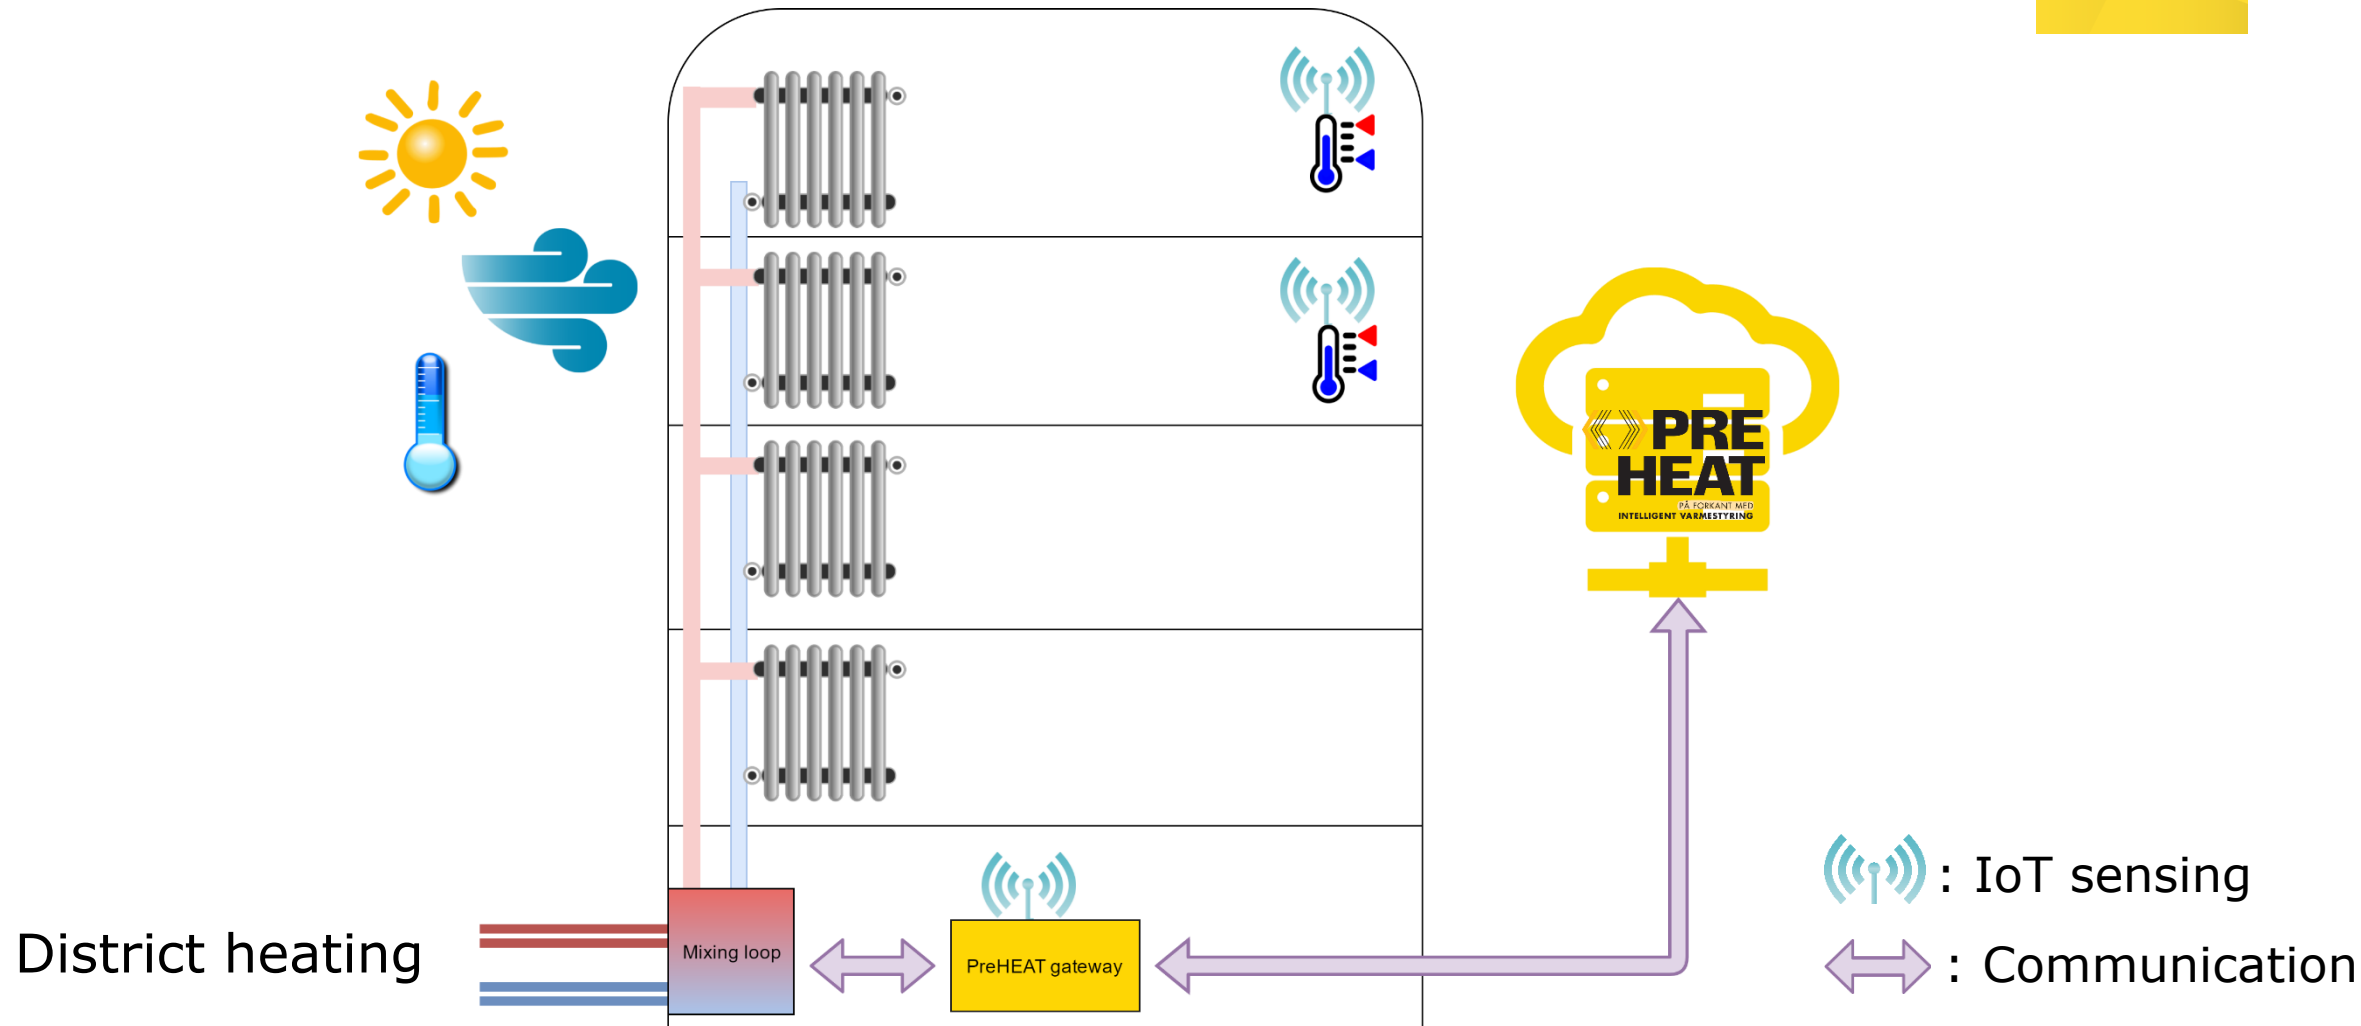

DH systems

- Integration of renewable energy sources
- Improved planning and operation
- Lowered losses in the system

- Improved thermal efficiency
- Reduced costs
- Keep heating installations well-running

End-users

PreHEAT is a cloud-based controller for the mixing loop at whole building level

PreHEAT is data-driven and forecast-based

- ❖ Optimises according to models built on historical data from the building

- ❖ Predicts the upcoming heating demand of the building
 - ❖ Uses weather forecasts
 - ❖ Extends standard heat curve controller by using sun, wind, and time
 - ❖ Accounts for indoor temperatures in critical zones

- ❖ Dynamically minimises the supply temperature
 - ✓ While ensuring comfort in critical zones of the building
 - ✓ Reducing thermal losses throughout the building

PreHEAT provides extra services

- ❖ Condition monitoring (regular reporting)
 - Energy usage
 - Indoor climate
 - State of the installation

- ❖ Fault-detection (building owner is contacted)
 - Abnormally high consumption
 - Bad cooling in heat exchangers
 - Defect valves and other components in technical rooms

- ❖ Can deliver demand forecasts (at building and aggregate level) to DH operators

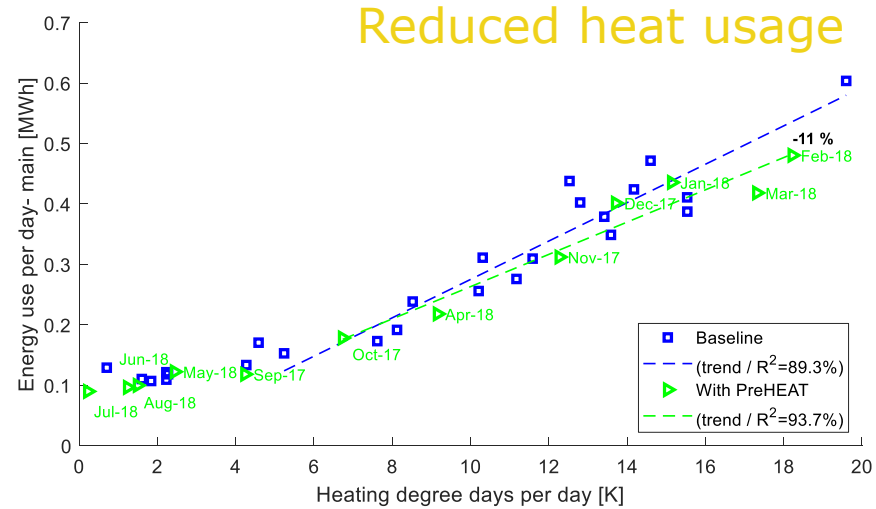

PreHEAT operates 24/7 in several buildings

- ❖ Deployment started in 2016
- ❖ The current PreHEAT fleet (located across Denmark) consists of:
 - ❖ 52 apartment blocks (all energy class C or older)
 - ❖ 15 single family houses
 - ❖ 1 school
- ❖ Operating environment characteristics – example from Aalborg:

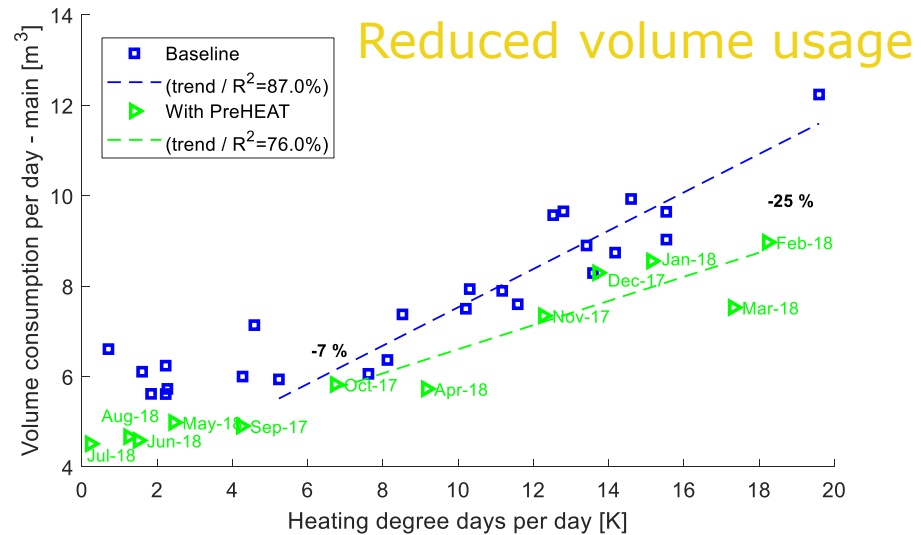

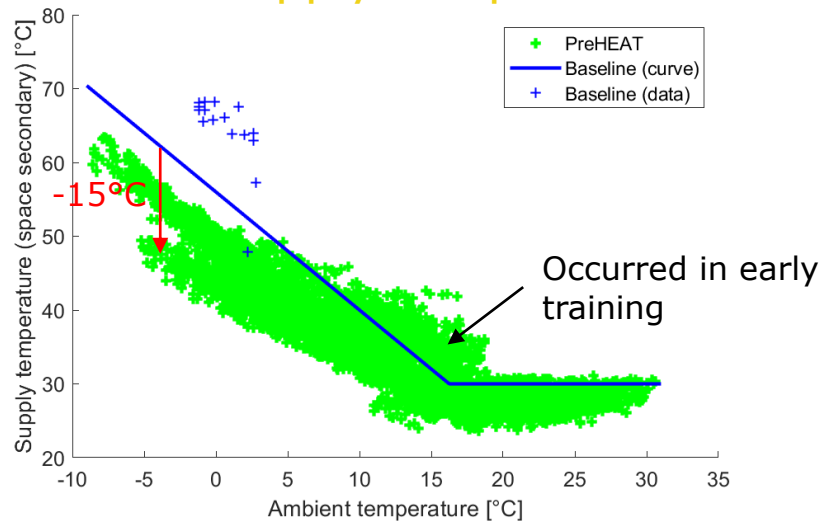

Aalborg DH context		
Heat price	1.92 (~45,9)	€/m ³ (€/MWh @ 36°C cooling)
Emission intensity	84 (marginal 130)	gCO ₂ eq/kWh

PreHEAT has improved energy efficiency and cooling

Example: M16 in Aalborg	
Construction	1964 (renovated)
Heated area	1 132 m ²
Energy class	C
Total heat usage	90 MWh/yr. (80 kWh/m ² /yr.)

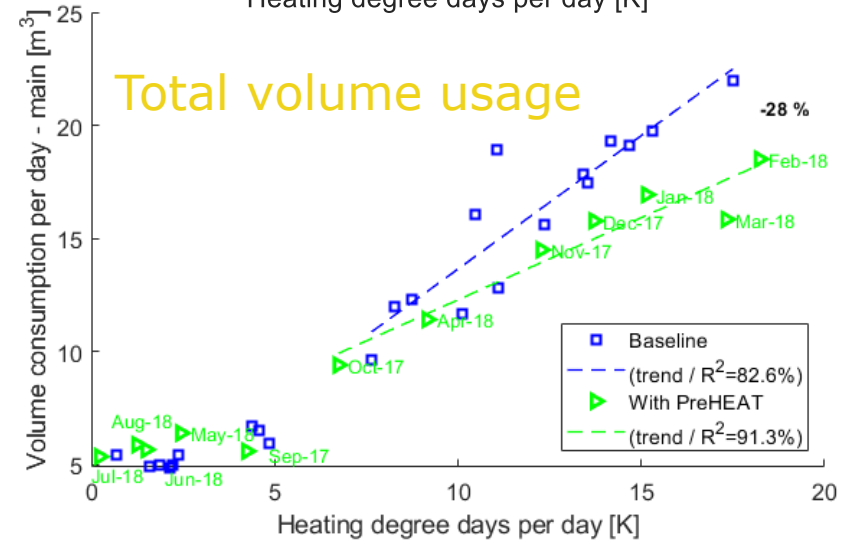

Reduced supply temperature

Performance varies among buildings

Example: R4 in Aalborg	
Construction	1958 (renovated)
Heated area	2 387 m ²
Energy class	B
Total heat usage	169 MWh/yr. (71 kWh/m ² /yr.)

Take home messages (1/2)

- ❖ Heating curves controllers have high margins resulting in unnecessary heat losses

- ❖ Advanced controllers can significantly reduce these margins,
 - ✓ without harming thermal comfort,
 - ✓ improving energy efficiency
 - ✓ increasing the cooling of the DH water

- ❖ Precise quantification of energy savings is difficult for such retrofits, as model uncertainties can be in close range to savings

Take home messages (2/2)

- ❖ Heating installations are often insufficiently monitored (e.g. manually and irregularly)
- ❖ A new 3rd party looking at the heating operation challenges the pre-existing status-quo, uncovering shortcomings and inefficiencies
- ❖ Tenant may need to be educated about correct use of thermostats and heaters
- ❖ Neogrid is enthusiastic about collaboration, and contribution to research projects
